^a detection of $\nu_\mu \rightarrow \nu_e$, upper limit on or determination of $\sin^2(2\theta_{13})$

^b detection of $\nu_\mu \rightarrow \nu_e$ appearance, even if $\sin^2(2\theta_{13}) = 0$; determine θ_{23} angle ambiguity

^c detection of the matter enhancement effect over the entire δ_{CP} angle range

^d measure the CP-violation phase δ_{CP} in the lepton sector; Nova2 depends on T2K2

^e beam is 'off-axis' from 0-degree target direction; ^f with/without RHIC operations
